Why α_s?

***Strong coupling α_s** enters in the calculation of every process that involves the strong interaction*

World average value

$\alpha_s(m_Z) = 0.1181 \pm 0.0011$ [PDG2016]

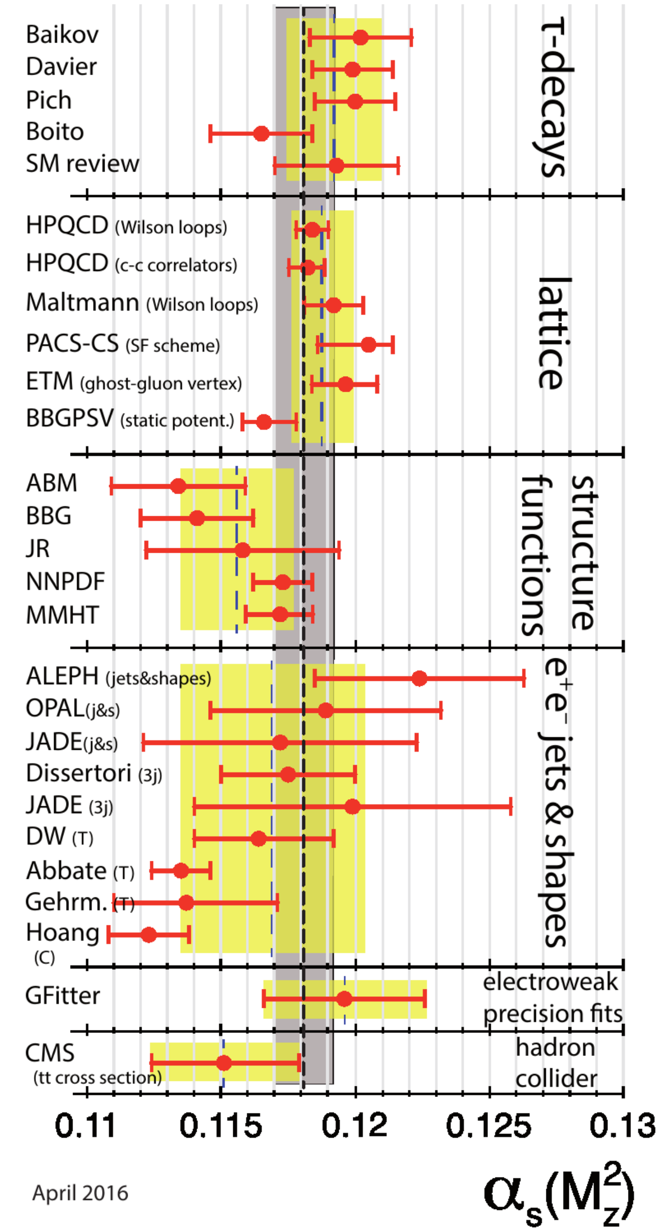
~0.9% relative uncertainty

Uncertainty on α_s

-> non-negligible uncertainties on many observables: e.g. Higgs production cross sections, branching ratios, ...

Jet measurements

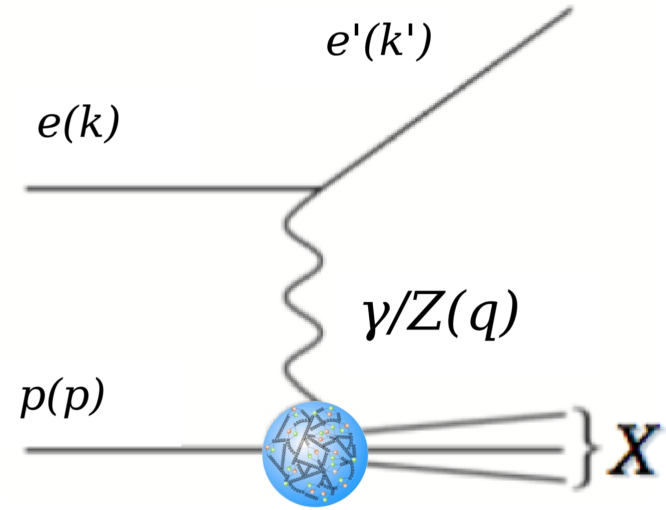
- Direct constraint on α_s
- So far no NNLO results available



Deep-inelastic *ep* scattering

Neutral current scattering (NC)

$ep \rightarrow e'X$



HERA *ep* collider in Hamburg

Kinematic variables

Photon virtuality

$$Q^2 = -q^2 = -(k - k')^2$$

Inelasticity

$$y = \frac{p \cdot q}{p \cdot k}$$

Data taking periods

- HERA I: 1994 – 2000
- HERA II: 2003 – 2007
- $\sqrt{s}$ = 300 or 319 GeV

H1 Experiment at HERA

H1 multi-purpose detector

Asymmetric design

Trackers

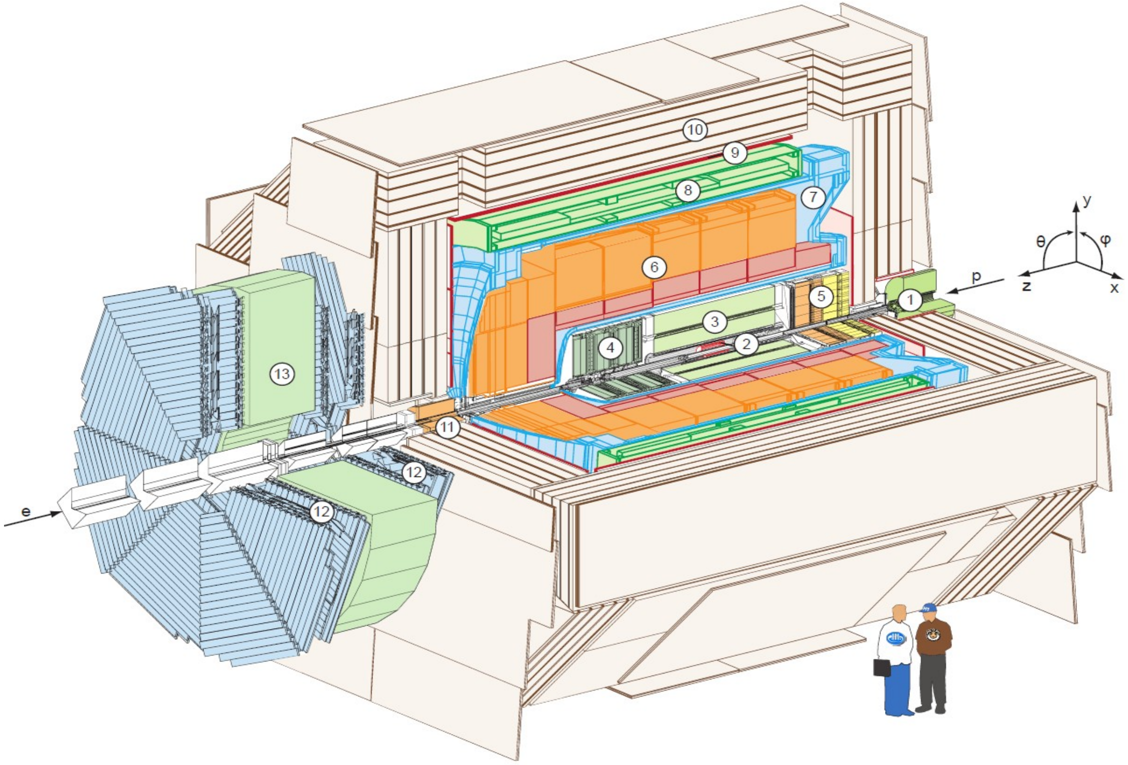
- Silicon tracker,
- Jet chambers
- Proportional chambers

Calorimeters

- Liquid Argon sampling calorimeter
- SpaCal: scintillating fiber calorimeter

Superconducting solenoid, 1.15T

Muon detectors

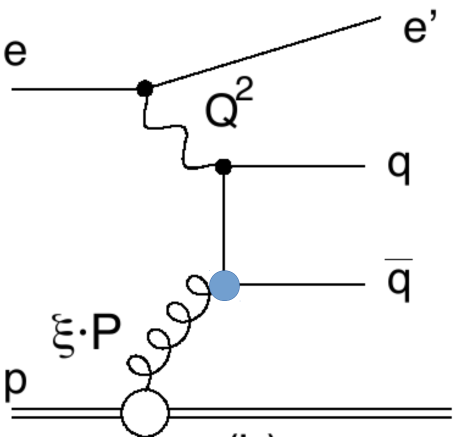


High experimental precision

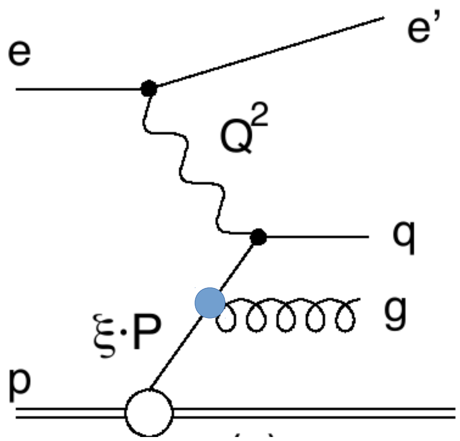
- Overconstrained system in NC DIS
- Electron measurement: 0.5 – 1% scale uncertainty
- Jet energy scale: 1%

Drawing of the
H1 experiment

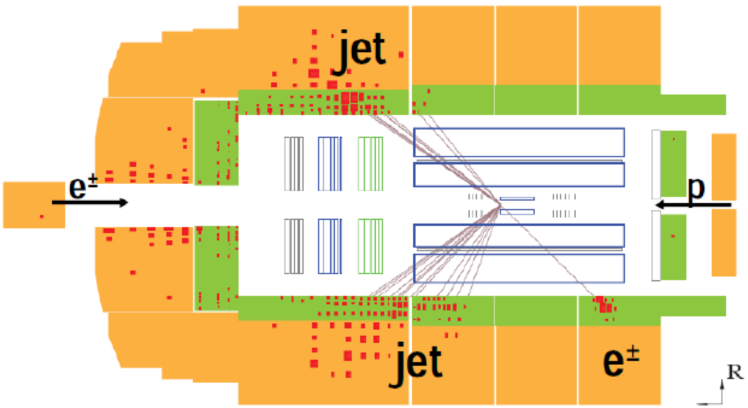
Jet production in DIS



Boson-gluon fusion



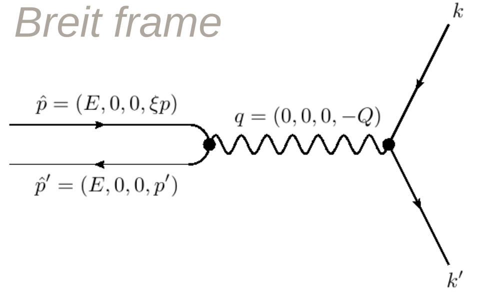
QCD Compton



Exemplary event display

Jets in DIS measured in Breit frame

- ep → 2jets
- Virtual boson collides 'head-on' with parton from proton
- Boson-gluon fusion dominant process
  QCD compton important only for high-p_T jets (high-x)



Jet measurement sensitive to α_s and gluon density

Inclusive jet cross sections

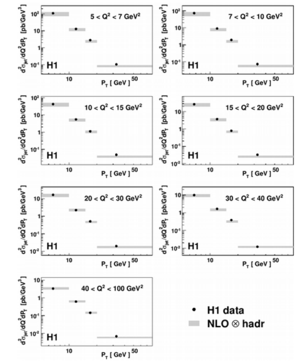
Inclusive jet cross sections

- $d\sigma/dQ^2dP_T^{jet}$
- 300 GeV, HERA-I & HERA-II
- low-Q^2 (<100 GeV^2) and high-Q^2 (>150 GeV^2) regions

Consistency

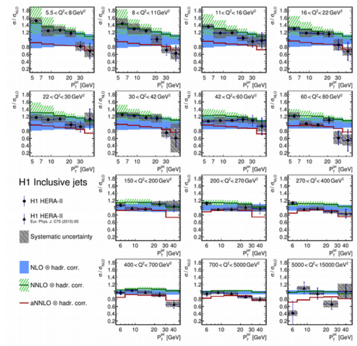
- kt-algorithm, R=1
- $-1.0 < \eta < 2.5$
- P_T ranges from 4.5 to 50 GeV

HERA-I low-Q^2



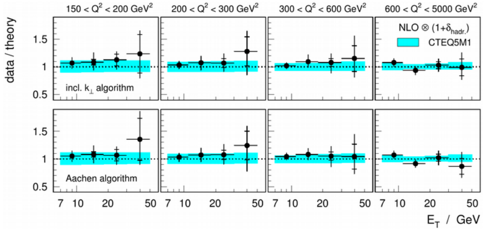
Eur.Phys.J.C67 (2010) 1

HERA-II low-Q^2



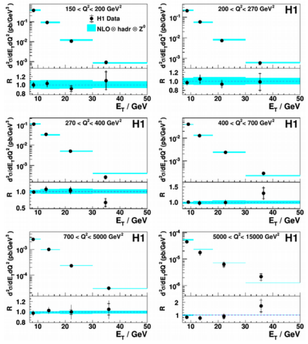
Eur.Phys.J. C77 (2017) 215

300 GeV high-Q^2



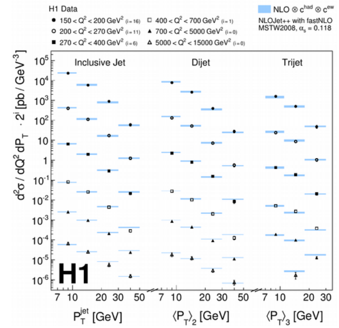
Eur.Phys.J.C19 (2001) 289

HERA-I high-Q^2



Phys.Lett.B653 (2007) 134

HERA-II high-Q^2



Eur.Phys.J.C75 (2015) 2
arXiv:1611.03421

Dijet cross sections

Dijet definitions

- $<p_T>$ greater than 5,7 or 8.5 GeV
- p_T^{jet} greater than 4, 5 or 7 GeV
- Asymmetric cuts on p_T^{jet1} and p_T^{jet2}
  (M_{12} cut for two data sets)

Dijet cross sections

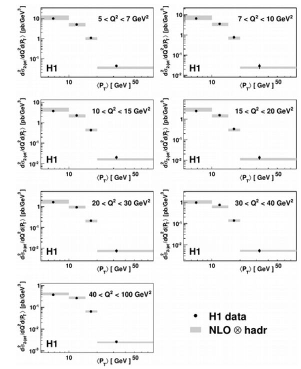
- $d\sigma/dQ^2d<p_T>$
- 300 GeV, HERA-I & HERA-II
- low-Q^2 and high-Q^2

Earlier studies

All inclusive jet and dijet data have been employed for α_s extractions previously

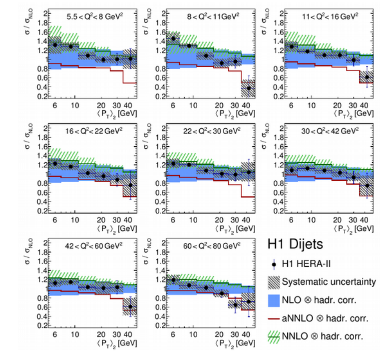
→ Data and uncertainties well-understood
→ NNLO theory is new

HERA-I low-Q^2



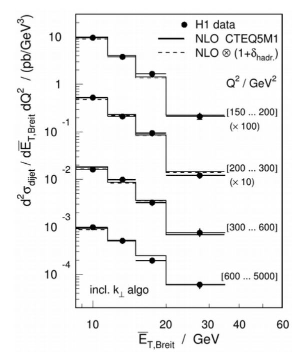
Eur.Phys.J.C67 (2010) 1

HERA-II low-Q^2



Eur.Phys.J. C77 (2017) 215

300 GeV high-Q^2



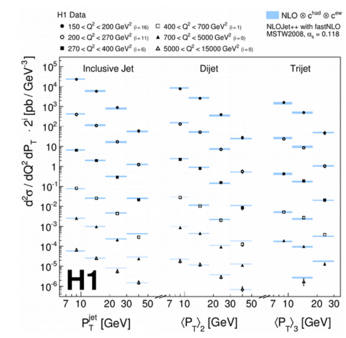
Eur.Phys.J.C19 (2001) 289

HERA-I high-Q^2

Dijet cross sections not statistically independent from HERA-II analysis

Eur.Phys.J.C65 (2010) 363

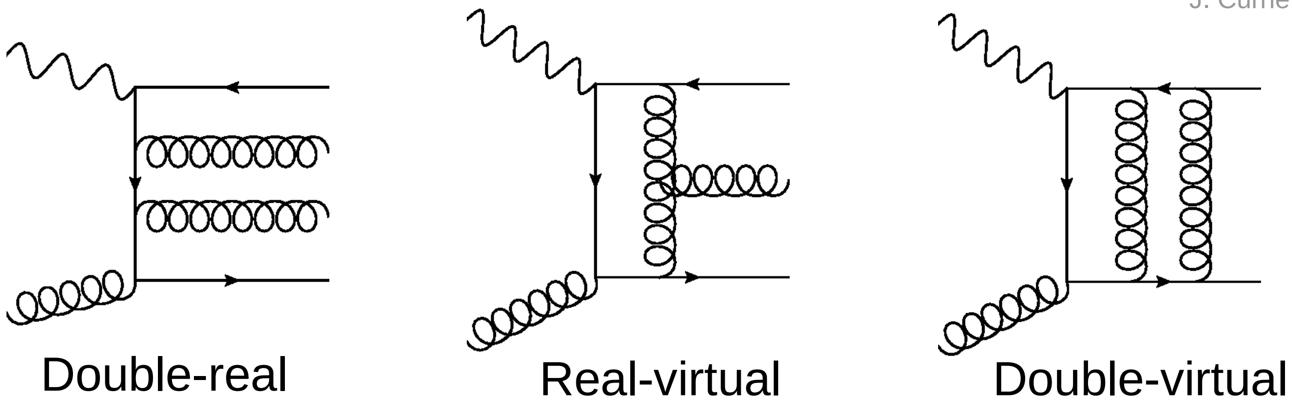
HERA-II high-Q^2



Eur.Phys.J.C75 (2015) 2

DIS jet production in NNLO

J. Currie, et al. [RPL 117 (2016) 042001]
J. Currie, et al. [JHEP 1707 (2017) 018]



$$\mathrm{d}\sigma^{RR,S}_{NNLO} \approx \underbrace{X(\{p_X\})}_{\text{antenna}} \overbrace{\mathrm{d}\Phi_3(\{p_X\})}^{\text{Antenna PS}} \times \underbrace{|\mathcal{M}(\{\widetilde{p_m}\})|^2}_{\text{reduced ME}} \overbrace{\mathrm{d}\Phi_m(\{\widetilde{p_m}\})}^{\text{reduced PS}} \times \underbrace{\mathcal{J}(\{\widetilde{p_m}\})}_{\text{jet function}}$$

A bit of history

- 1973 asymptotic freedom of QCD
  [PRL 30(1973) 1343 & 1346]
- 1993 NLO studies of DIS jet cross sections
  [Phys. Rev. D49 (1994) 3291]
- 2016 NNLO corrections for DIS jets
  [Phys. Rev. Lett. 117 (2016) 042001], [arXiv:1703.05977]

Antenna subtraction

- Cancellation of IR divergences with local subtraction terms
- Construction of (local) counter terms
- Move IR divergences across different phase space multiplicities

Scale dependence of NNLO cross sections

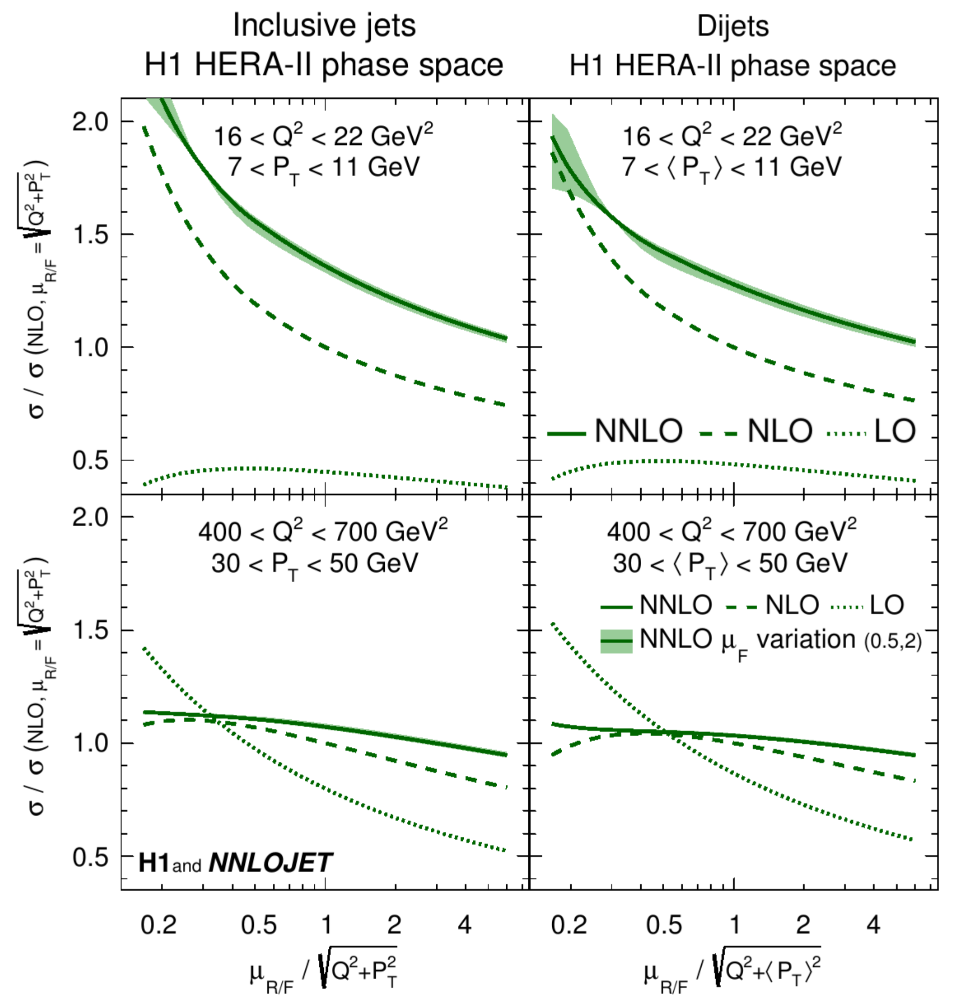
Simultaneous variation of μ_R and μ_F

At lower scales

- Significant NNLO k-factors
- NNLO with reduced scale dependence
- Inclusive jets with higher scale dependence than dijets

At higher scales

- NNLO with reduced scale dependence
- μ_F dependence very small



Two distinct fitting approaches

In this analysis: α_s is determined with two distinct approaches

α_s fit

Determine $\alpha_s(m_Z)$ 'directly' from inclusive jet and dijet cross sections
→ Requires as additional input: PDFs

α_s+PDF fit

Determined $\alpha_s(m_Z)$ together with PDFs from normalised inclusive jet and dijet cross sections and additionally all H1 inclusive NC & CC DIS data
→ Determine α_s, but also
→ PDF is determined: **H1PDF2017**

Two distinct fitting approaches

In this analysis: α_s is determined with two distinct approaches

α_s fit

Determine $\alpha_s(m_Z)$ 'directly' from inclusive jet and dijet cross sections
→ Requires as additional input: PDFs

α_s+PDF fit

Determined $\alpha_s(m_Z)$ together with PDFs from normalised inclusive jet and dijet cross sections and additionally all H1 inclusive NC & CC DIS data
→ Determine α_s, but also
→ PDF is determined: **H1PDF2017**

α_s-fit methodology

α_s determined in χ_2-minimisation

- $\alpha_s(m_Z)$ is a free parameter to NNLO theory prediction σ_i

$$\chi^2 = \sum_{i,j} \log\frac{\varsigma_i}{\sigma_i}(V_{\rm exp} + V_{\rm had} + V_{\rm PDF})^{-1}_{ij} \log\frac{\varsigma_j}{\sigma_j}$$

ς_i	H1 jet data
σ_i	NNLO theory
V	covariance matrices

- NNLO theory is sensitive to $\alpha_s(m_Z)$

$$\sigma_i = \sum_{n=1}^{\infty}\sum_{k=g,q,\bar{q}}\int dx\, f_k(x,\mu_F)\hat{\sigma}^{(n)}_{i,k}(x,\mu_R,\mu_F)\cdot c_{\rm had}$$

Hard ME's

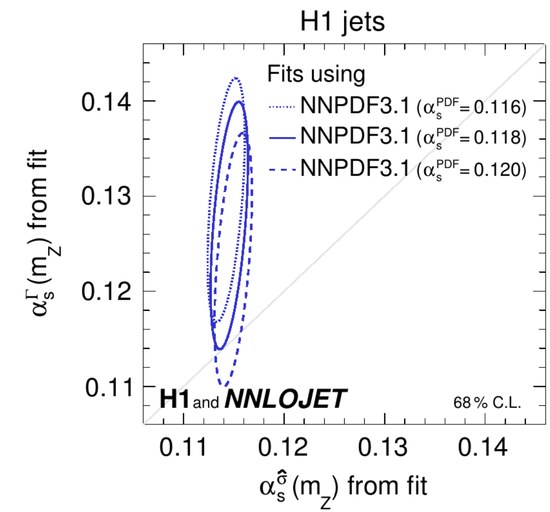
$$\hat{\sigma}^{(n)}_{i,k} = \alpha_s^n(\mu_R)\tilde{\sigma}^{(n)}_{i,k}(x,\mu_R,\mu_F)$$

PDFs $\frac{\partial f}{\partial \alpha_s} = \frac{\mathcal{P}\otimes f}{\beta}$

- α_s dependence of PDF is accounted for by using $\mu_{F,0}$=20GeV and applying DGLAP

Perform fits to

- All <u>inclusive jet data</u> sets (137 data points)
- All <u>dijet data</u> sets (103 data points)
- All <u>H1 jet data taken together</u> (denoted as 'H1 jets')
  (exclude HERA-I dijet data as correlations to inclusive jets are not known)



Strong coupling in NNLO from jets

α_s from individual data sets

- High experimental precision
- Scale uncertainty is largest (theory) error
- All fits with good χ^2
  -> consistency of data

Fit to all data

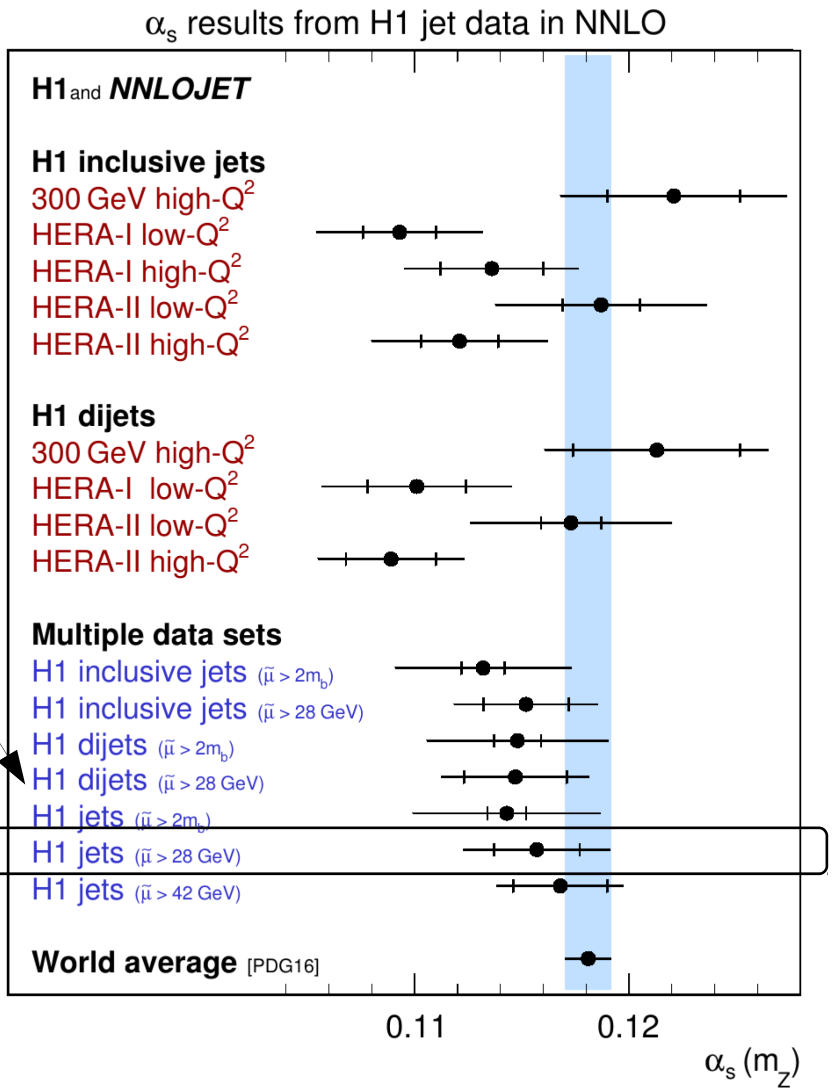
- Small exp. uncertainty: $\Delta\alpha_s = \pm 0.0009$ (exp)
- Considerable NNLO-scale uncertainty

Main result

- Inclusive jets & dijets
  Restricted to: μ>28GeV (91 data points)

$$\alpha_s(m_Z) = 0.1157\,(20)_{\rm exp}\,(6)_{\rm had}\,(3)_{\rm PDF}\,(2)_{{\rm PDF}\alpha_s}\,(3)_{\rm PDFset}\,(27)_{\rm scale}$$

- Moderate exp. precision (due to μ>28GeV)
- Scale uncertainty dominates
- PDF uncertainties negligible



Scale dependence of α_s fit

α_s results as a function of scale factors

- Smooth results for studied scale variations
- μ_R variation with more impact than μ_F

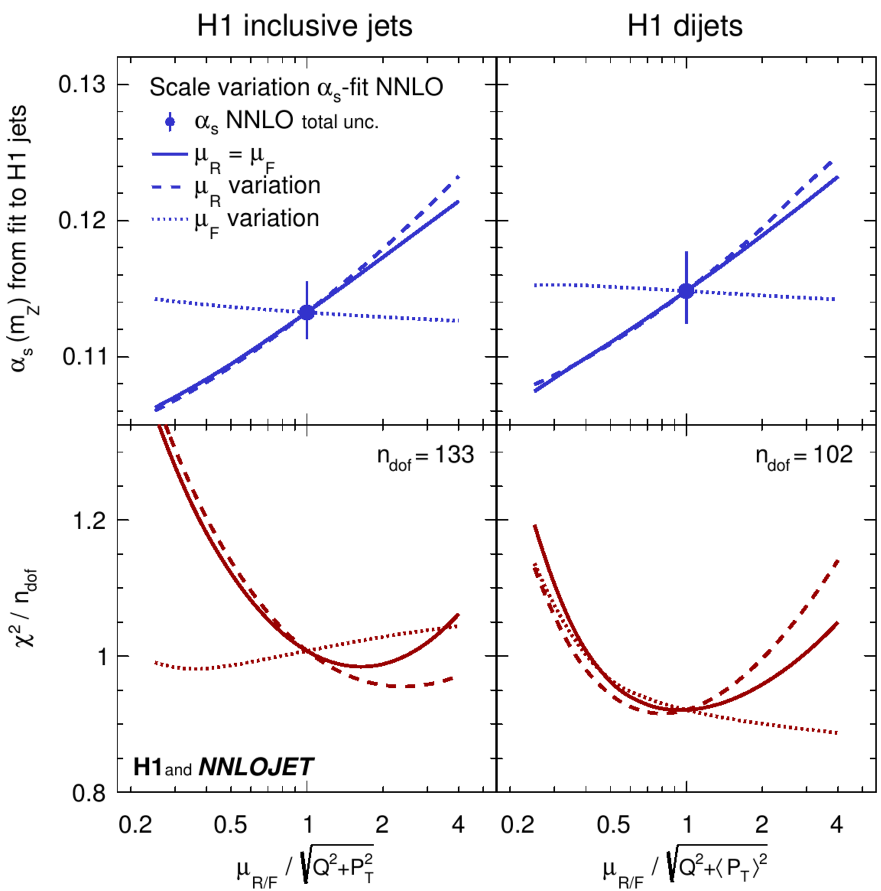
Scale choice

$$\mu^2 = Q^2 + p_T^2$$

- With p_T being p_T^{jet} or $\langle p_T \rangle$

χ^2 values

- somewhat a 'technical parameter'
  -> not intended to be a parabolas
- χ^2 values increase for large scale factors
  -> large scale factors disvafored



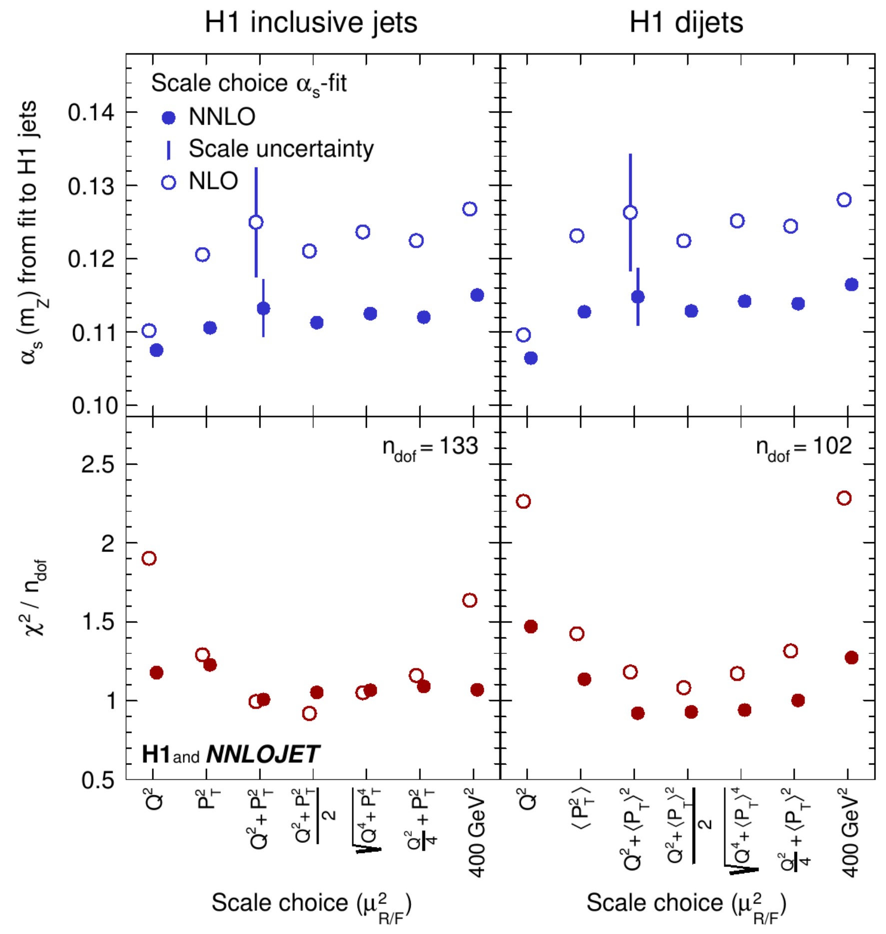
Scale choice for α_s fit

Study scales calculated from Q^2 and p_T

'p_T' refers to: p_T^{jet} or $\langle p_T \rangle$

α_s results and χ^2 values

- Spread of results covered by scale uncertainty
- χ^2 values are similar for different choices



NLO matrix elements

- Large scale uncertainty
- Relevant dependence of result on scale choice
- Mainly larger χ^2 values than NNLO
- Larger fluctuation of χ^2 values than NNLO

NNLO with reduced scale dependence

Dependence on the PDF

PDF is an external input to NNLO calculation

PDF fitting groups differ

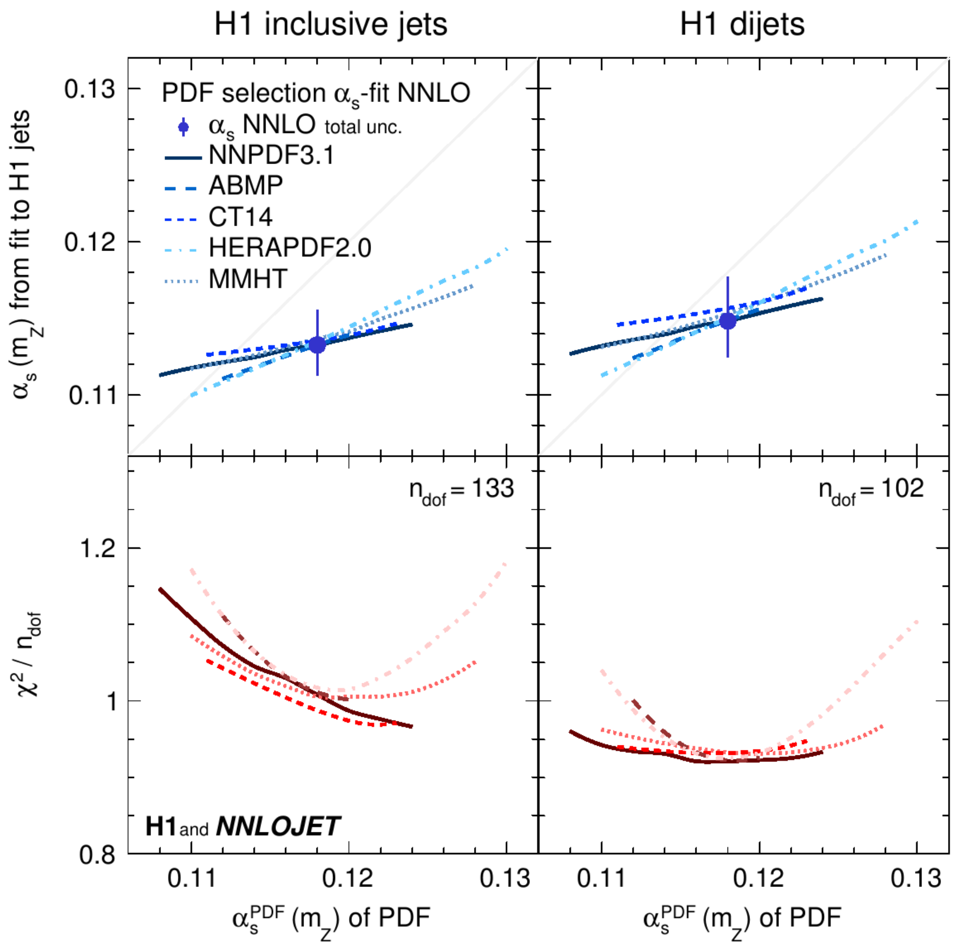
- choice of input data sets,
  PDF parameterisations, model parameters,
  fit methodology, etc...
- Though
  different PDFs appear to be quite consistent

Choice of α_s for PDF determination

- $\alpha^{PDF}_s(m_Z)$ important input parameter to PDF fit
- Small correlation with fitted results

Our (main) α_s result

- almost independent on PDF assumptions



Comparison of NNLO predictions with data

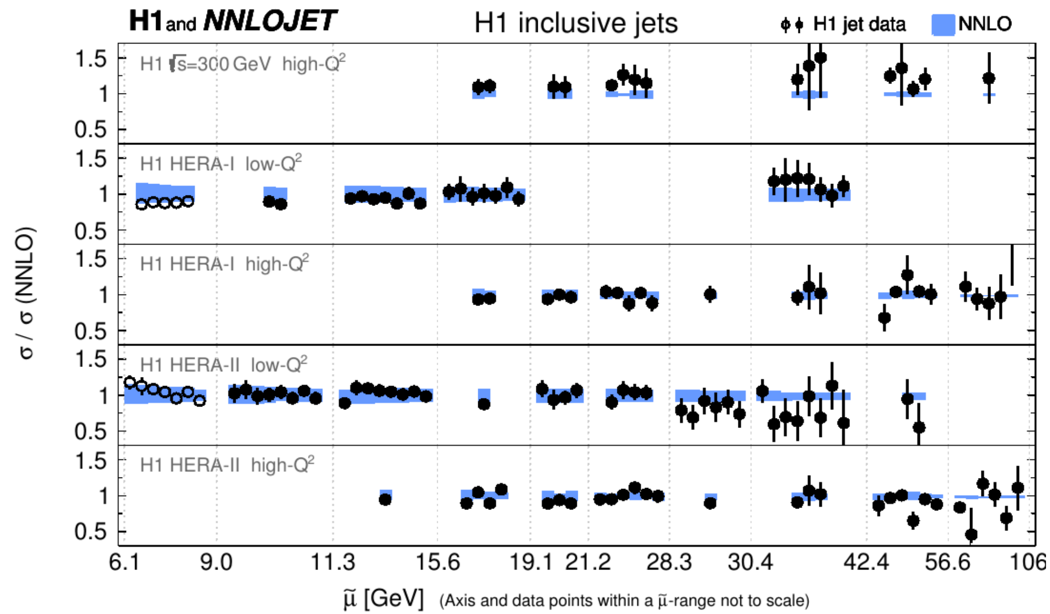
All H1 jet cross section data compared to NNLO predictions

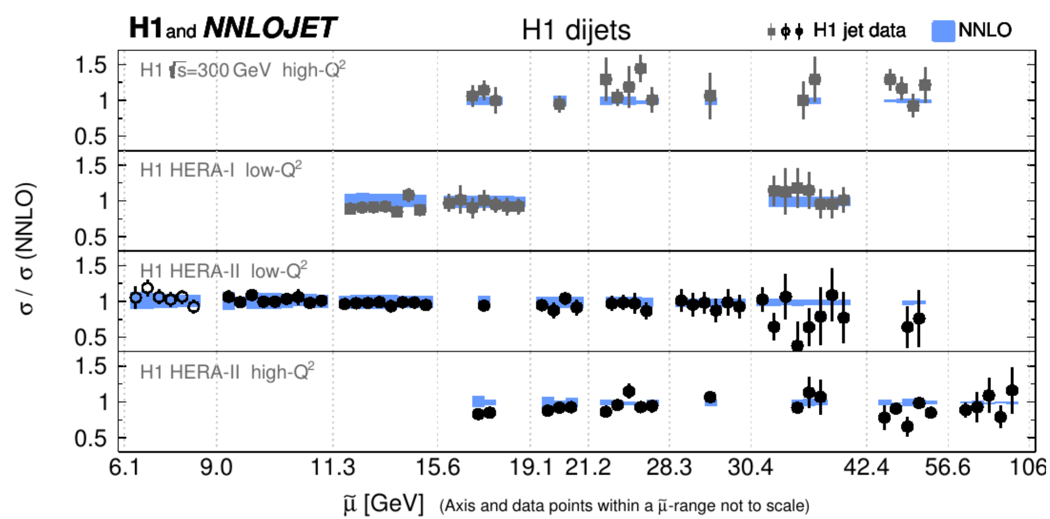
- Inclusive jets
- Dijets

Overall good agreement

- NNLO describes all data very well
- Also quantified of course by good χ^2 values of the fits

Great success of pQCD





Tests of running of strong coupling

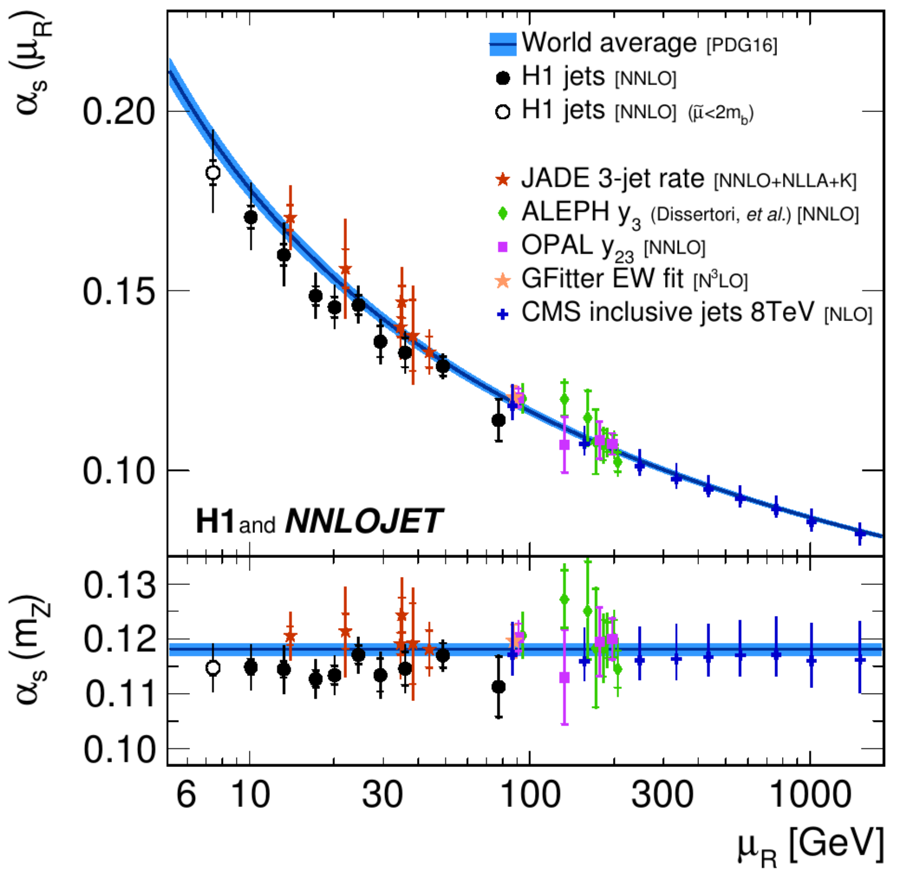
Test running of strong coupling

- Perform fits to <u>groups of data points</u> at similar scale
- Assumes running to be valid within the limited range covered by interval
- All fits have good χ^2

Results

- Consistency with expectation at all scales
- Scale uncertainty dominates at lower μ
- Consistency of inclusive jets and dijets (backup)

High precision in range: $7 < \mu < 90$ GeV



Two distinct fitting approaches

In this analysis: α_s is determined with two distinct approaches

α_s fit

Determine $\alpha_s(m_Z)$ 'directly' from inclusive jet and dijet cross sections
→ Requires as additional input: PDFs

α_s+PDF fit

Determined $\alpha_s(m_Z)$ together with PDFs from normalised inclusive jet and dijet cross sections and additionally all H1 inclusive NC & CC DIS data
→ Determine α_s, but also
→ PDF is determined: **H1PDF2017**

'PDF+α_s-fit': H1PDF2017

Perform H1-alone PDF fit: H1PDF2017

- Use (all) H1 inclusive DIS data
- Use (all) H1 normalised jet cross section data

-> 1529 data points

Normalised jet cross sections

- Jet cross sections normalised to inclusive DIS
- Correlations of jets and inclusive DIS cancel

PDFs are parameterised as

$$xf(x)|_{\mu_0} = f_A x^{f_B}(1-x)^{f_C}(1+f_D x + f_E x^2)$$

- Similar to HERAPDF/H1PDF

Mind: all PDFs are commonly determined predominantly from (H1) inclusive DIS data

Cross section: ~ PDF ⊗σ

$$\sigma_i = \sum_{k=g,q,\bar{q}} \int dx\, f_k(x,\mu_F)\hat{\sigma}_{i,k}(x,\mu_R,\mu_F)\cdot c_{\mathrm{had},i}$$

Normalised jets

Data set [ref.]	Q^2 domain	Inclusive jets	Dijets	Normalised inclusive jets	Normalised dijets	Stat. corr. between samples

Result

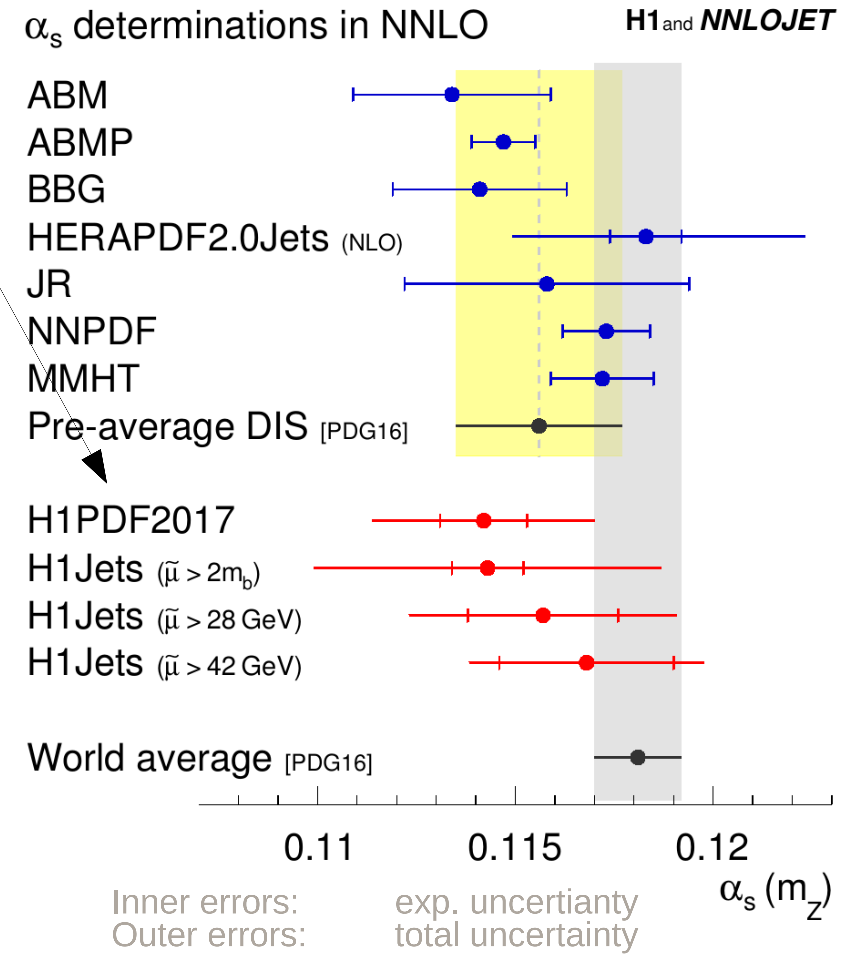
α_s determined in PDF+α_s-fit

$$\alpha_s(m_Z) = 0.1142\,(11)_{\rm exp,had,PDF}\,(2)_{\rm mod}\,(2)_{\rm par}\,(26)_{\rm scale}$$

- High experimental precision
- Moderate theory uncertainty from NNLO

Comparison

- Similar precision than most of other (comparable) determinations
- Theory/scale uncertainties:
  → Scale uncertainty: vary all scales by 0.5 and 2
  → other PDF fitting groups commonly determine only exp. uncertainties
  → Comparison of 'full' uncertainties difficult
- All H1 results self-consistent
- Results competitive with world average
- All results from DIS data tend to be lower than world average value



PDF+α_s-fit – H1PDF2017 [NNLO]

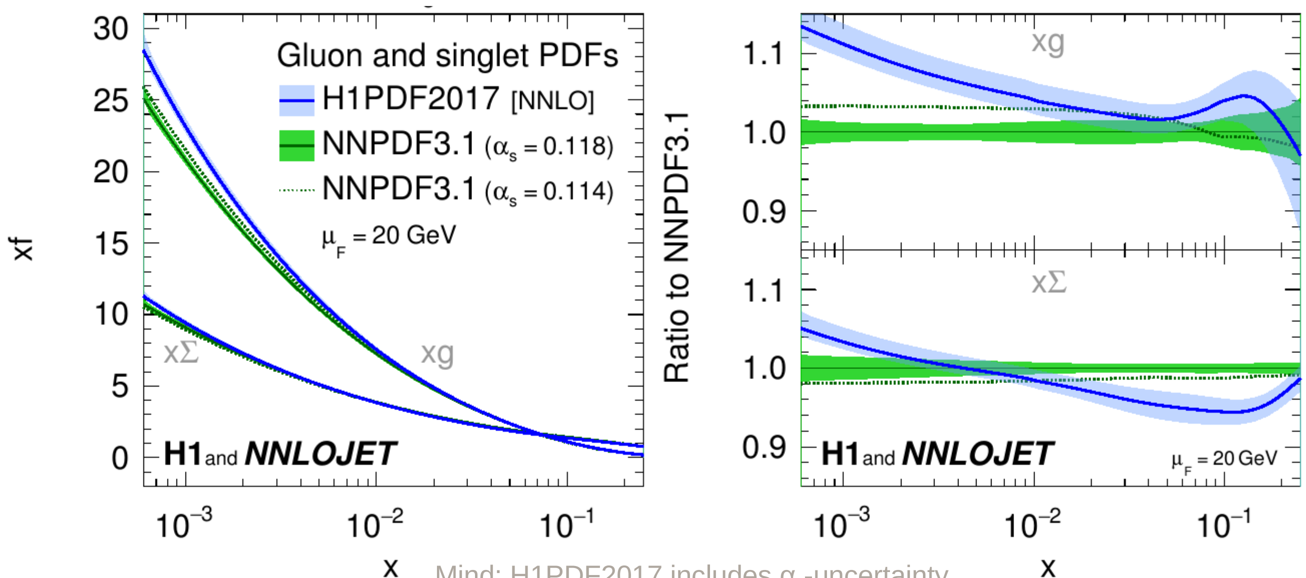
Result for PDFs

- Set of PDFs determined with high precision
- χ^2/ndf ~ 1.01 (n_{pts}=1529)
- Despite α_s is a <u>free parameter</u> to the fit: precision is competitive with global PDF fits, which use fixed α_s

H1PDF2017

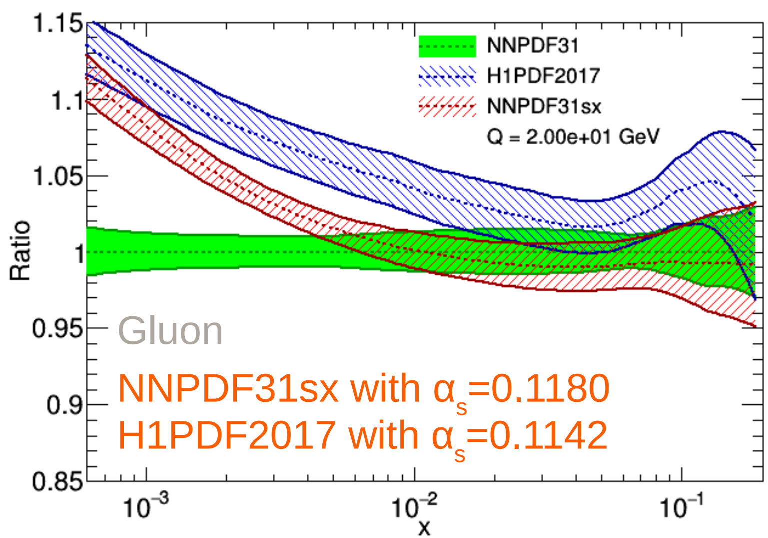
- Precise determination of the <u>gluon PDF</u> and <u>α_s</u>
- Gluon at lower *x*-values tends to be higher (than e.g. NNPDF3.1)
- Gluon very similar to NNPDF3.1sx, which includes low-x resummation (no low-Q^2 data included in our H1 fit)

Comparison of H1PDF2017 and NNPDF3.1



Mind: H1PDF2017 includes α_s-uncertainty, whereas NNPDF does not

Comparison with NNPDF3.1sx



Apfelweb. Thanks to S. Carraza

Assess impact of H1 jet data

Correlation of α_s and gluon

- gluon at (x=0.01, μ_F=20GeV)

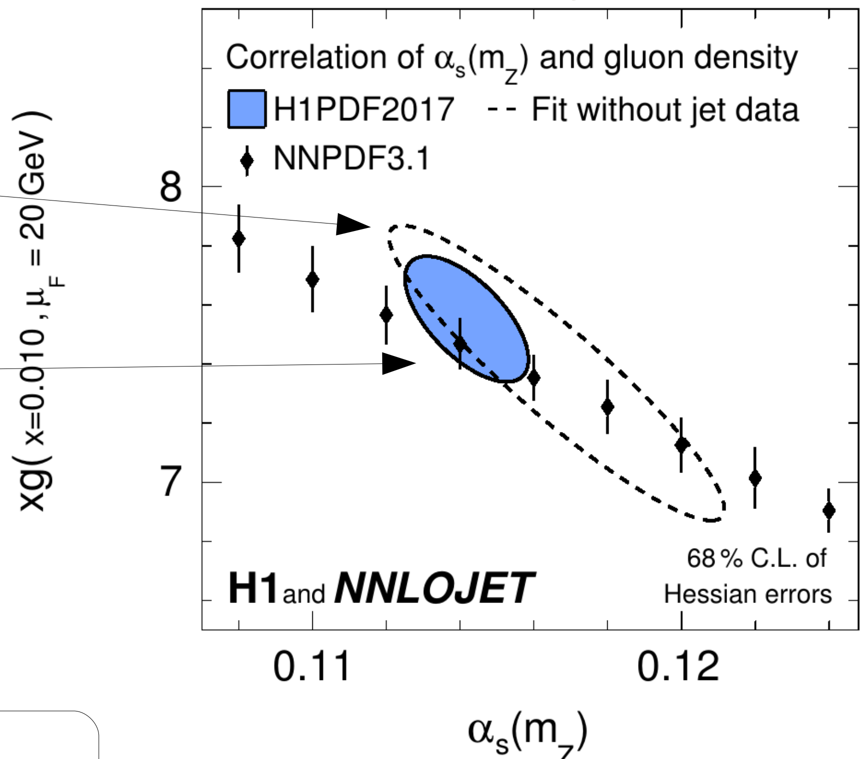
Fit to inclusive DIS data alone

- Sizeable uncertainties
→ Inclusive DIS data alone does not allow for simultaneous determination of gluon and α_s

H1 jet data

- Simultaneous determination of gluon and α_s becomes possible
  → High precision !
- Mind here: NNPDF uncertainties do not include uncertainty on α_s

Correlation of α_s and g



H1 jet data allows for precise simultaneous determination of α_s and gluon density

Summary

All H1 jet data confronted with NNLO predictions

- NNLO provides improved description w.r.t. NLO
- Quantitative comparison of all data
- NNLO predictions studied in great detail

NNLO used for determination of $\alpha_s(m_Z)$

- α_s-fit $\quad \alpha_s(m_Z) = 0.1157\,(20)_{\text{exp}}\,(6)_{\text{had}}\,(3)_{\text{PDF}}\,(2)_{\text{PDF}\alpha_s}\,(3)_{\text{PDFset}}\,(27)_{\text{scale}}$
- α_s+PDF-fit $\quad \alpha_s(m_Z) = 0.1142\,(11)_{\text{exp,had,PDF}}\,(2)_{\text{mod}}\,(2)_{\text{par}}\,(26)_{\text{scale}}$
- High experimental and theoretical precision

NNLO predictions for jets are used for PDF fits for the first time

- Successful determination of gluon-density and simultaneously also $\alpha_s(m_Z)$
- Competitive precision of PDFs and $\alpha_s(m_Z)$
- H1PDF2017 available at LHAPDF

Fruitful collaboration of theoreticians and experimentalists (H1 & NNLOJET)

Study of total uncertainty

Scale uncertainties at various scales μ

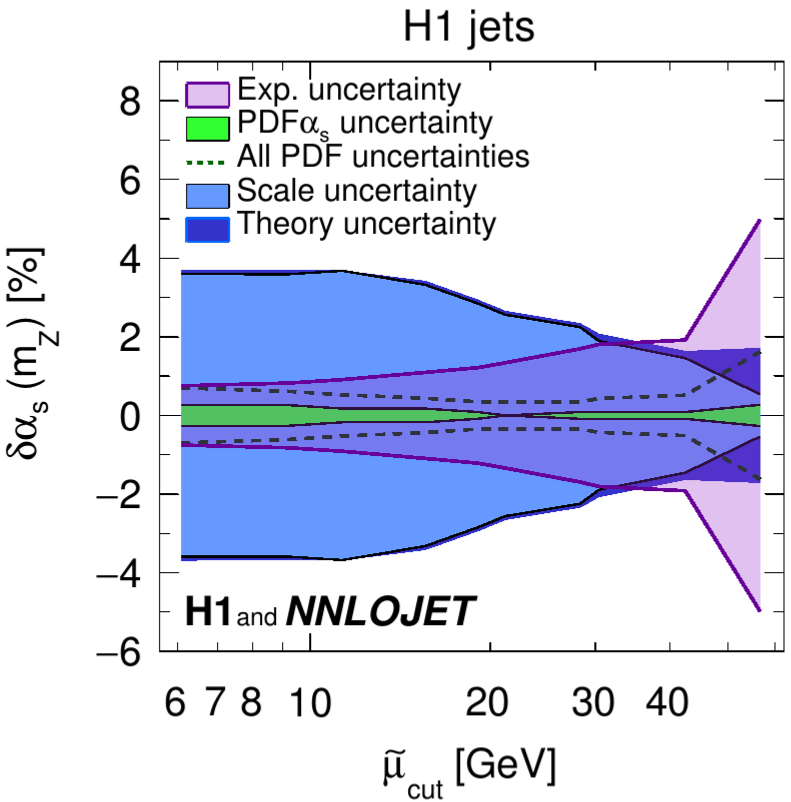
- At low-μ: large scale uncertainties...
- ... but also high sensitivity to $\alpha_s(m_Z)$

Fits imposing a cut on scale μ

- Repeat α_s fits:
  successively cut away data below μ_{cut}

Results

- Scale uncertainty decreases with μ_{cut}
- Exp. uncetainty increases with μ_{cut}



Cut on μ can balance between exp. and theoretical uncertainties at constant total precision

$\alpha_s(m_Z)$ dependence of cross sections

Jet cross sections directly sensitive to α_s

$$\sigma_i = \sum_{n=1}^{\infty} \sum_{k=g,q,\bar{q}} \int dx\, f_k(x,\mu_F)\, \hat{\sigma}_{i,k}^{(n)}(x,\mu_R,\mu_F) \cdot c_{\text{had}}$$

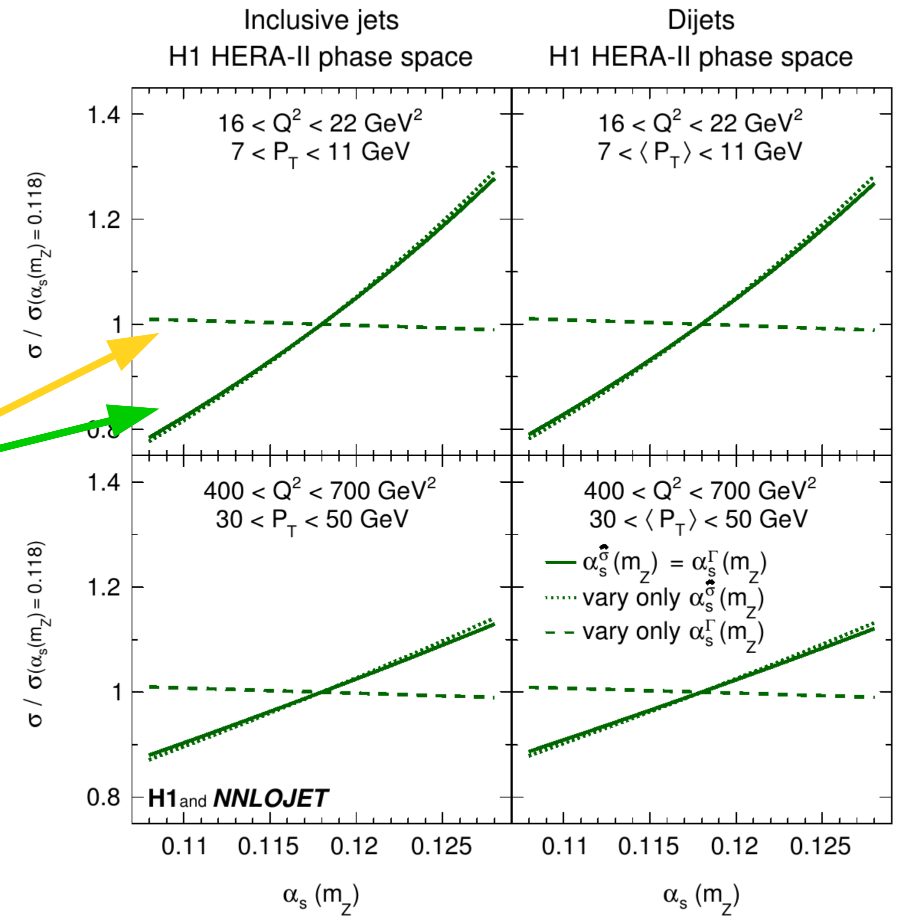
Two α_s-dependencies

PDFs $\frac{\partial f}{\partial \alpha_s} = \frac{\mathcal{P} \otimes f}{\beta}$

Hard ME's

$$\hat{\sigma}_{i,k}^{(n)} = \alpha_s^n(\mu_R)\,\tilde{\sigma}_{i,k}^{(n)}(x,\mu_R,\mu_F)$$

- *Predominant α_s-sensitivity from ME's*
- *PDF's with almost negligible sensitivity*



α_s dependencies separately fitted

Fits to

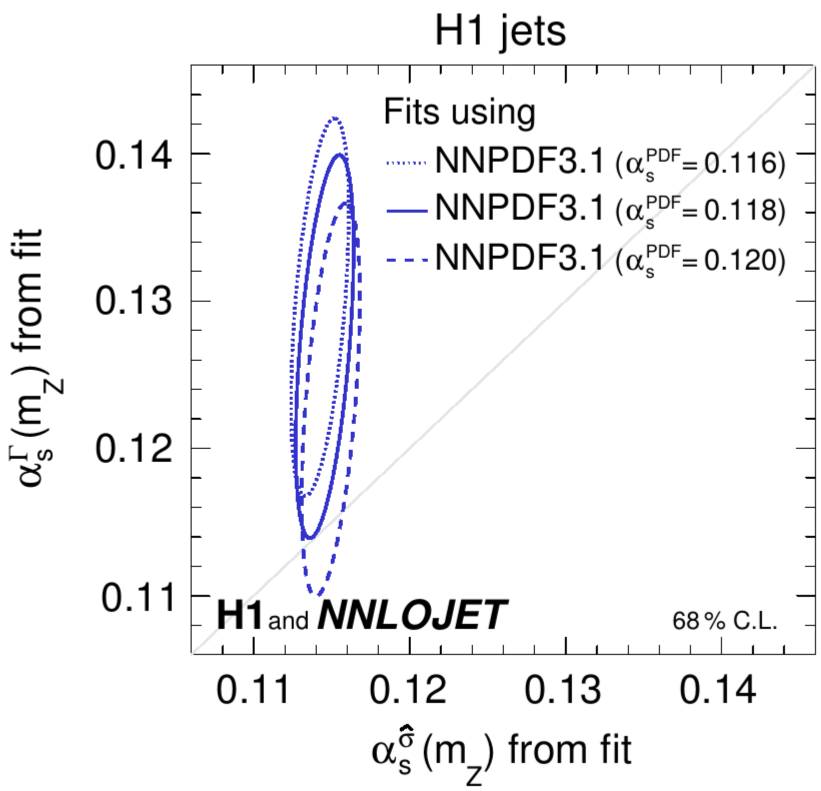
- Inclusive jet and dijet data fitted together
- Fits performed for different PDFs

Fits with two free α_s parameters

$$\sigma_i = f(\alpha_s^f(m_Z)) \otimes \hat{\sigma}_k(\alpha_s^{\hat{\sigma}}(m_Z)) \cdot c_{\text{had}}$$

Results

- Most sensitivity arises from matrix elements
- Best-fit α_s-values in PDF's and ME's are consistent
- Anti-correlation between $\alpha_s^{PDF}(m_Z)$ and $\alpha_s^{\Gamma}(m_Z)$



$\alpha_s(m_Z)$ values from H1 jet cross sections

Inclusive jet cross sections

Inclusive jet cross sections
- low Q^2: 4.5 < P_T < 50 GeV
- high Q^2: 5 < P_T < 50 GeV

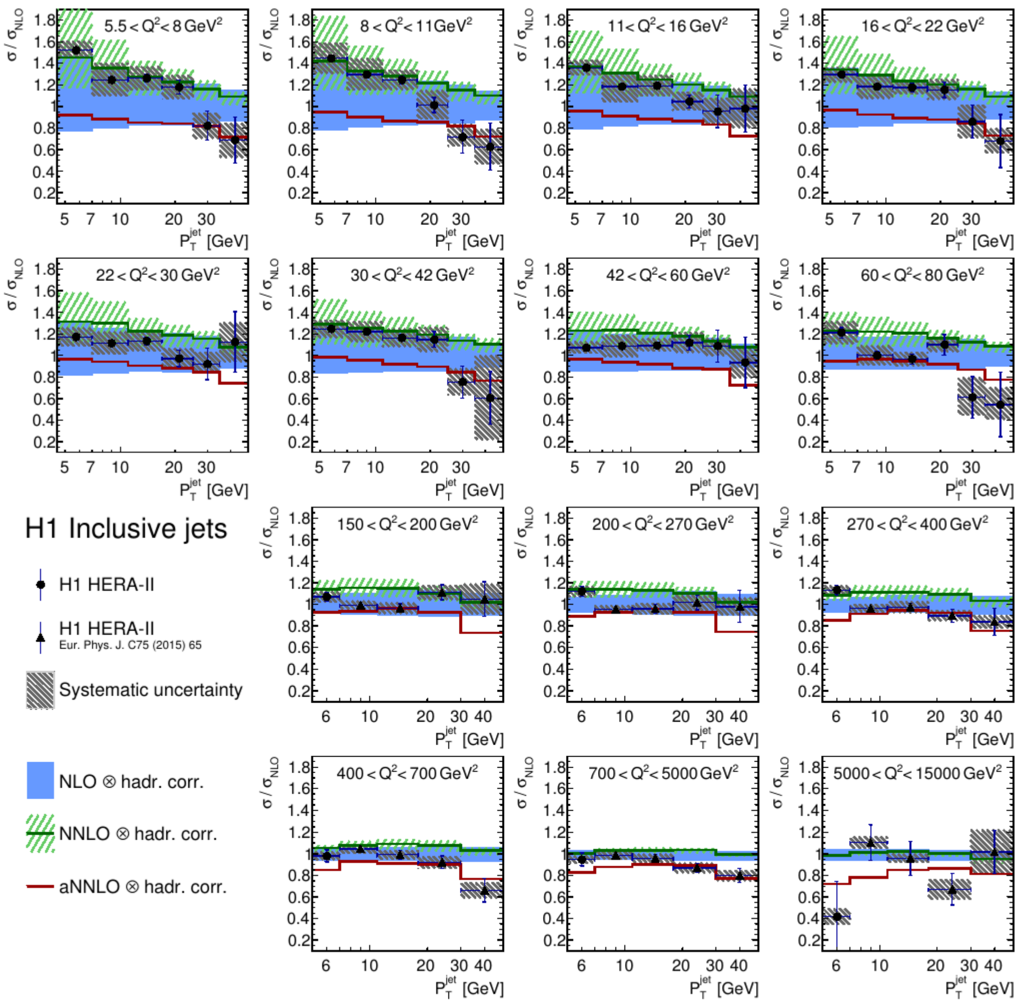
Predictions
- NLO, aNNLO & NNLO

NLO
- Data well described within uncertainties

aNNLO
- Somewhat improved shape description

NNLO
- Improved shape and normalisation
- Reduced scale uncertainties for larger values of μ_r

Also measured
- Normalised inclusive jet cross sections



Ratio of dijet cross sections to NLO

Scale uncertainty

- So-called '7-point scale variation':
  Vary μ_r and μ_f independently by factors of 2 and 0.5, but exclude variations in 'opposite' directions

Ratio to NLO prediction

- NLO give reasonable descriptions within large scale uncertainties
- aNNLO improves shape
  - aNNLO expected to improve description at high <p$_T$>
- NNLO improves shape dependence
  - NNLO predictions have smaller scale uncertainties than NLO at high-<p$_T$>
